

CUSTOMER CHURN ANALYSIS

A TELCOM SERVICE CHURN ANALYSIS PROJECT USING EXCEL

Preparation By: Janice Kipkiror

Tools Used: Excel

PROJECT OVERVIEW

This project aimed to analyze the factors contributing to customer churn in a telecom service.

OBJECTIVES

- Data cleaning of the dataset.
- Correlation of the factors with tenure and churn.
- Operation and the visualization of the Churn Rate.
- EDA analysis
- Creation of a dashboard to visualize the analysis

DATASET

This is a secondary dataset from Kaggle. It contains 7043 records with 21 features.

TOOLS

- Excel

DATA CLEANING

In data cleaning, the following were done: Removal of blanks and errors. Luckily for this dataset, it did not have a lot of errors. Moreover, Power Query was used for data cleaning. Also, categorical columns were converted for EDA analysis.

EXPLORATORY DATA ANALYSIS

From the pivot tables created, the following EDA analysis was done:

1. Churn Vs Internet

Here, Internet Service seems not to be a factor in the churn rate of the service. This is because customers with no internet service have a relatively low churn rate. This erases the assumption that people with no internet service contribute to the churning of service.

2. Churn Vs Payment Details

Electronic Check, a way of payment, records a high number of people who've churned compared to other ways.

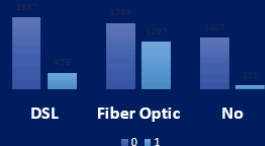

3. Churn Vs Gender

This analysis is not significant to the churn rate. Both genders record an equal distribution in the churn rate.

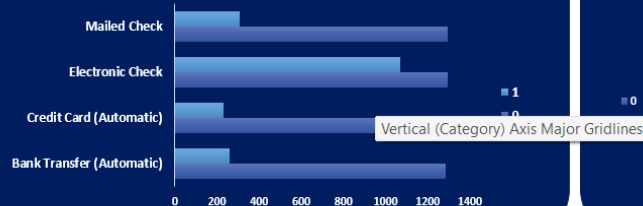

4. Churn Vs Contract

Month-to-month contract records a higher churn rate, proving right that those customers who subscribe to a monthly package are likely to exit the service.

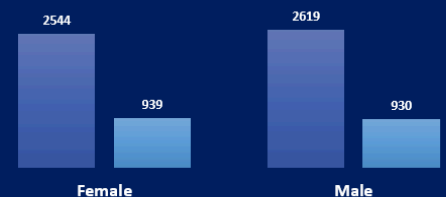

Churn Vs Internet Service

Churn Vs Payment Details

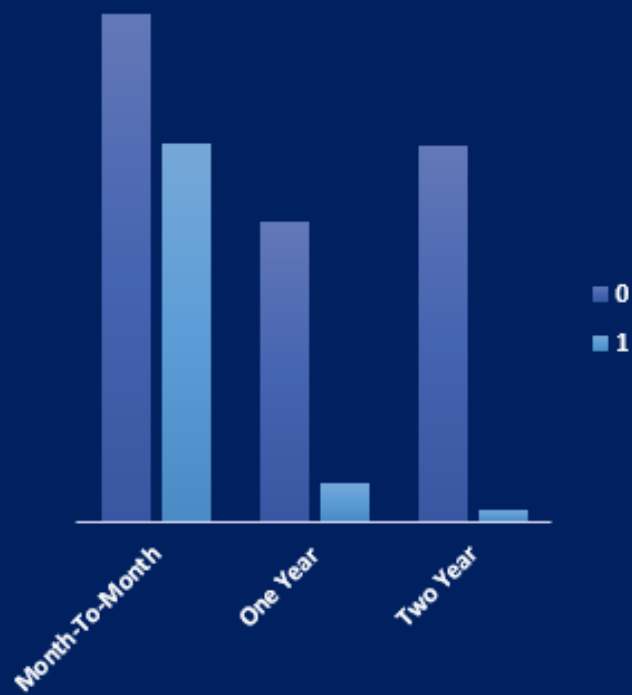

Churn Vs Gender

Tenure Distribution

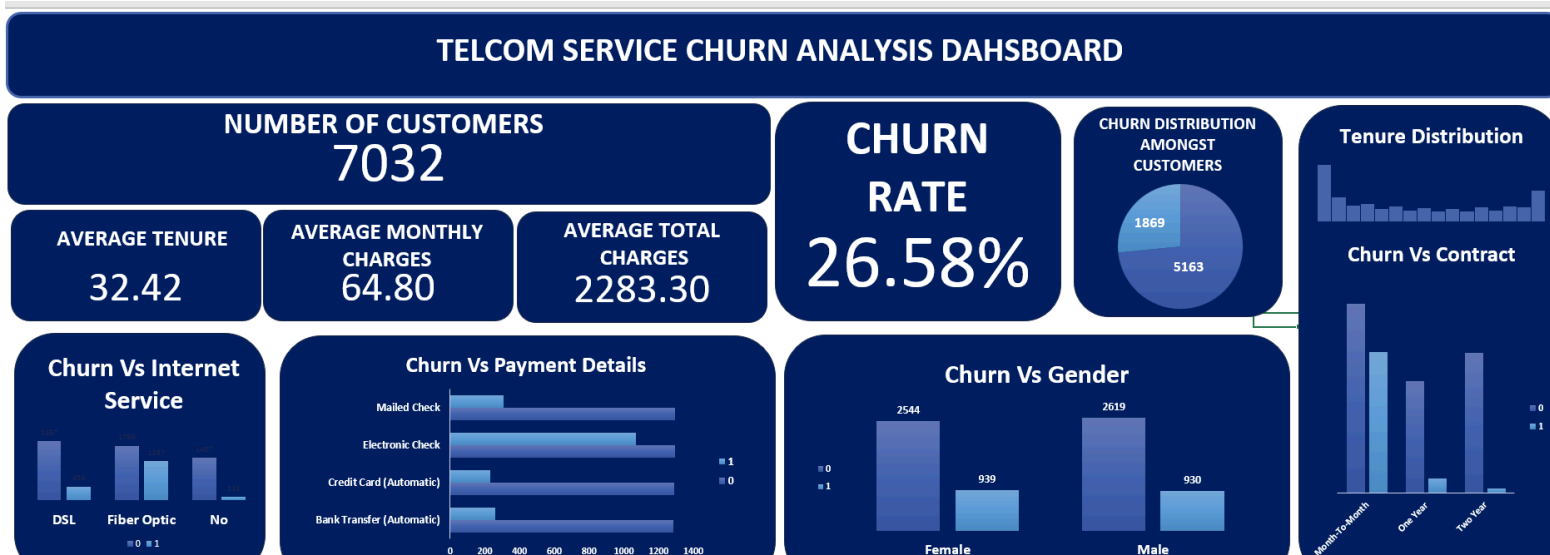

Churn Vs Contract

DASHBOARD

What is entailed in the dashboard:

1. KPIs
2. Charts

KEY INSIGHTS

- The main factor that determines the churn in this dataset is the contract and tenure of the customers.

CHALLENGES

- Most features in this dataset are statistically insignificant to this analysis.

CONCLUSION

- The project analyzed the relation of the churning rate and features in the dataset. The churn rate, however, was not quite high.
